

# DWA\_08 Discussion Questions

In this module you will continue with your “Book Connect” codebase, and further iterate on your abstractions. You will be required to create an encapsulated abstraction of the book preview by means of a single factory function. If you are up for it you can also encapsulate other aspects of the app into their own abstractions.

To prepare for your session with your coach, please answer the following questions. Then download this document as a PDF and include it in the repository with your code.

---

1. What parts of encapsulating your logic were easy?

Adding the open model function for opening the book preview and the updateBookModal function because there isn't too much complexity.

---

2. What parts of encapsulating your logic were hard?

Trying to include the close modal listener in the factory function. It was difficult because the close modal doesn't need an event to trigger but my factory function does. So I just kept it separate because to me that made the most sense.

---

3. Is abstracting the book preview a good or bad idea? Why?

It is a good idea because it keeps all of its functionality in one environment making it more cleaner and maintainable.

But I also feel it doesn't benefit much from a factory function other than keeping all its logic in one place because you aren't doing too many complex things with the book preview other than showing a different book. Like for example
